ABSTRACT

Bacon Farmer Workman Engineering & Testing, Inc. (BFW) performed a stream habitat and wetland delineation for part of the “Triple Rail Site” property that is located in McCracken County, Kentucky south of Noble Road. The delineation was performed between May – June 2019 based on fluctuating weather conditions and site access. The project area includes approximately 430 - 450 acres and is located in McCracken County. The delineation was performed to determine if wetlands and/or streams were located on the property. Eleven (11) emergent wetlands, eight (8) forested wetlands, five (5) open waters, seven (7) ephemeral streams, and six (6) intermittent streams were located within the project area.

1. INTRODUCTION

1.1 PURPOSE

Bacon Farmer Workman Engineering & Testing, Inc. (BFW) performed a wetland delineation on the property located south of Noble Road in Paducah, Kentucky. The field work was completed between May and June 2019 based on fluctuating weather conditions and site access. The property is approximately 430 - 450 acres in size. It is located in the Lower Ohio watershed. The property is being reviewed for environmental compliance for proposed industrial development. A map which depicts the project area and associated wetlands/streams can be found in Appendix A.

The wetland delineation was conducted according the guidelines set forth by the 1987 Corps of Engineers Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Atlantic Gulf Coastal Plain Region (Version 2.0). The United States Army Corps of Engineers (USACE) is the regulating authority of Section 404 of the Clean Water Act (CWA). This regulating entity must make the final decision with regards to the jurisdictional status of this site.

The purpose of this study was to investigate the project area, identify areas meeting the technical criteria for wetlands, delineate the jurisdictional extent of the wetland basins, map other aquatic resources, and classify the wetland habitat. This field investigation also documented other natural aquatic resources in the project area that may also require regulatory consideration for the project. This field delineation of wetlands and aquatic resources will be the basis on which regulated impacts to these resources will be determined for a future interchange reconstruction and improvement project.

1.2 SITE DESCRIPTION

The project area is located in McCracken county. From Interstate 24, proceed to Exit 3 and proceed west for approximately 1.33 miles to Meredith Road. Turn right and proceed north for approximately 1.36 miles to Noble Road. Turn left and proceed west for approximately 2.44 miles. The entrance to the property will be located on the left (south). The project area begins here at Latitude N37°07'31.66" and Longitude W88°44'26.87".

The wetland delineation investigation area consisted of agricultural fields interspersed with occasional wooded areas and streams. These habitats are described in more detail in the following sections.

2. TECHNICAL DEFINITIONS

2.1 WETLANDS

Section 404 of the Clean Water Act defines Wetlands as:

"areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."

The EPA and the Corps use the 1987 Corps of Engineers Wetlands Delineation Manual and Regional Supplements to define wetlands for the Clean Water Act Section 404 permit program. Section 404 requires a permit from the Corps or authorized state for the discharge of dredged or fill material into the waters of the United States, including wetlands.

The 1987 Corps of Engineers Wetlands Delineation Manual and Regional Supplements organizes characteristics of a potential wetland into three (3) categories: soils, vegetation and hydrology. The manual and supplements contain criteria for each category. With this approach, an area that meets all three (3) criteria is considered a wetland. These criteria are detailed below:

2.1.1 Hydrophytic Vegetation

Hydrophytic vegetation, due to morphological, physiological, and/or reproductive adaptation(s), has the ability to grow, effectively compete, reproduce, and/or persist in anaerobic soil conditions. Individual species have been assigned a wetland indicator status by the National Wetland Plant List designated by USACE.

A plant community is considered hydrophytic when more than 50% of the dominant species from all strata are Obligate Wetland (OBL), Facultative Wetland (FACW), or Facultative (FAC). If all dominants are FAC, the vegetation criteria can be disregarded, and the determination is based on soil and hydrology criteria.

Indicator Status	Probability of Occurrence in Wetlands
Obligate Wetland - OBL	> 99%
Facultative Wetland - FACW	67-99%
Facultative - FAC	34-66%
Facultative Upland - FACU	1-33%
Obligate Upland - UPL	< 1%

Secondary vegetation rules include observed physiological adaptations, plants growing in saturated soils, and the FAC neutral test.

2.1.2 Hydric Soils

Hydric soils are present if they have been classified as hydric or when they possess characteristics associated with anaerobic soil conditions. Hydric soils are those that are gleyed or have a low chroma matrix (2 or less) with redoximorphic features, or a matrix chroma 1 with or without redoximorphic feature in the upper 10-inches. These designations are made utilizing a Munsell

Soil Color Chart.

2.1.3 Hydrology

Hydrology in wetlands occurs in areas inundated permanently or periodically at mean water depths < 6.6 feet, or if the soil is saturated to the surface for five percent (5%) of the prevalent vegetation's growing season. Indicators of wetland hydrology could be present above or below the surface.

Primary indicators of hydrology include, but are not limited to:

- inundation
- saturation in the upper 12 inches
- oxidized rhizospheres
- watermarks on standing structures
- water stained leaves
- sediment deposits

Secondary indicators of wetland hydrology [two (2) or more required] include, but are not limited to:

- FAC neutral test
- wetland drainage patterns
- soil survey data

3. METHODS & MATERIALS

3.1 WETLAND DELINEATION

The wetland delineation was conducted according the guidelines set forth by the 1987 Corps of Engineers Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Atlantic and Gulf Coastal Plain Region (Version 2.0).

3.1.1 Soils

Soils were observed for hydric soil characteristics. Soils were examined in cores taken with a sharpshooter shovel or soil probe. Soil profiles were observed at a depth necessary to confirm hydric soil characteristics. Typical soil profile depths are typically within 12-18 inches below ground surface to allow for: (1) observation of an adequate portion of the soil profile to determine presence/absence of hydric soil characteristics; (2) observation of hydrology including depth to the water table and saturated soils; and, (3) identification of disturbances (e.g., buried horizon, plow line, etc.). Where site conditions preclude observing soil profile depths at the typical 12-18 inches below ground surface or where observed hydric soil indicators are documented above or below 12-18 inches below ground surface, justification is provided. Soil color determinations were made using MUNSELL Soil Color Charts (Gretag-Macbeth 1994). Site soil characteristics were compared to those mapped and described in the Soil Survey for McCracken County (USDA 2016). Hydric soil characteristics were compared to those identified in the Atlantic and Gulf Coastal Plain Region Supplement (USACE 2012) and the most recent version of the Natural Resources Conservation Service (NRCS) publication Field Indicators of Hydric Soils in the United States, Version 7.0 (USDA 2010). Hydric Soil Category ratings (USDA 2016) were also reviewed for soils in the project area. Results were recorded on the attached data forms (Appendix B).

The proposed project area primarily consisted of the Ginat silt loam and Routon silt loam according to the USDA soil survey (Appendix A). There were other soil types, which included Calloway, Cascilla-Colp-Wheeling, Falaya-Collins, Grenada, Hurst, Kurk, Loring, Okaw, and Waverly. However, it should be noted that only the more prominent soil series were discussed below.

The Ginat soils series has slopes which range from 0 to 2 percent, poorly drained, and are rarely flooded. They are typically found on stream terraces and are prime farmland if they are drained.

The Routon soils series has slopes which range from 0 to 2 percent, poorly drained, and are rarely flooded. They are typically found on stream terraces and are prime farmland if they are drained.

The Calloway soils series has slopes which range from 0 to 2 and 2 to 4 percent, somewhat poorly drained, and are rarely flooded. They are typically found on flats and ridges and are prime farmland if they are drained.

The Cascilla-Colp-Wheeling complex soils series has slopes which range from 2 to 25 percent, are well drained, and occasionally flood. They are typically found on floodplains, stream terraces, and drainageways.

The Falaya-Collins complex soils series has slopes which range from 0 to 2 percent, are somewhat poorly drained, and permeability is slow. They are

typically found on floodplains and drainageways.

The Grenada soils series has slopes which range from 0 to 6 percent, moderately well-drained, and can be severely eroded. They are typically found on flats, floodplains, and drainageways, and are prime farmland if they are drained and not severely eroded.

The Hurst soils series has slopes which range from 0 to 2 percent, somewhat poorly drained, and are rarely flooded. They are typically found on stream terraces and are prime farmland if they are drained.

The Kurk soils series has slopes which range from 0 to 2 percent and are somewhat poorly drained. They are typically found on stream terraces and are prime farmland if they are drained.

The Loring soils series has slopes which range from 6 to 12 percent, are moderately well drained, and are severely eroded. They are typically found on ridges and are not prime farmland.

The Okaw soils series has slopes which range from 0 to 2 percent, poorly drained, and are rarely flooded. They are typically found on stream terraces and are prime farmland if they are drained.

The Waverly soils series has slopes which range from 0 to 2 percent, poorly drained, and are occasionally flooded. They are typically found on floodplains and drainageways and are prime farmland if they are drained.

3.1.2 Vegetation

Wetland plant species nomenclature follows the National Wetland Plant List (USACE 2018). Identification was aided when necessary with field guides for the region. Vegetation was sampled in nested circular plots:

- 5-ft radius for herbaceous species
- 15-ft radius for shrubs
- 30-ft radius for trees and vines.

Vegetation was classified using the USACE 2018 National Wetland Plant list. Unless otherwise stated, aerial coverage dominance was determined using the 50/20 rule. Under the 50/20 rule, any plant species that equals or exceeds 20% of the aerial coverage of the plot is a dominant plant. In addition, the cumulative total of all dominant plants (OBL, FACW, or FAC) must be equal to or greater than 50% of the aerial coverage of the plot. If no plant species equals or exceeds 20% of the cumulative total aerial coverage of the plot, then the dominant plants are the plants that when ranked in decreasing order of abundance and summed, immediately exceed 50% of the plots aerial coverage when added together.

The majority of the delineated area included previously farmed agricultural fields. There were some forested locations and several open water areas also located on the property.

3.1.3 Hydrology

Hydrology was determined by observing field indicators. Local soil survey data was reviewed but not automatically implied without field verification. Hydrologic indicators were recorded on the data forms and are also noted in photographs

of the site (Appendix C). The majority of the hydrology was documented as saturation, standing water, and crayfish burrows.

3.2 STREAM ASSESSMENT

A Rapid Bioassessment Protocol (RBP) low gradient field data sheet was completed for each stream located within the project area. Documentation for the streams includes photographs, location, typical cross-section, and total length. The protocol matrix used to assess habitat quality is based on key physical characteristics of the waterbody and surrounding land. Habitat is defined as the quality of in-stream and riparian habitat that influences the structure and function of the aquatic community in a stream. This matrix provides an effective means of evaluating and documenting habitat quality at each site. Habitat parameters evaluated are related to overall aquatic life and are a potential source of limitation to aquatic biota. Site selection for assessment was based upon a probabilistic approach to provide information about the overall status or condition of each site (Barbour, et al. 1999).

For this report, the assessment focuses on the matrix in which physical characteristics of the stream is evaluated on 10 parameters with scales from 0 to 20, in which 20 represents a pristine situation. The parameters address characteristics including substrate, flow regime, sediment deposition, and riparian zone quality, among others. The potential score for a pristine evaluation is a total score of 200, but a high habitat assessment score can still represent a poor stream when taking into account conductivity, which contributes to overall ecological integrity.

Stream lengths, channel location, and limits were determined in the field utilizing manual measuring techniques including range finding, pacing, global positioning, and verification of mapping. Stream flow was determined in the field based upon stream status at the time of visit. The final determination of stream quantity and jurisdiction will be decided by the USACE. See Appendix B for the stream assessment (RBP) forms and photographs.

4. JURISDICTIONAL WATERS SUMMARY & DESCRIPTIONS

Eleven (11) emergent wetlands, eight (8) forested wetlands, five (5) open waters, seven (7) ephemeral streams, and six (6) intermittent streams were located within the project area.

4.1 WETLANDS

Nineteen (19) wetland areas totaling approximately 8.65 acres occur within the study area. Eleven (11) of the wetland areas are emergent (PEM) and the other eight (8) wetland areas are forested (PFO). These wetland areas are denoted on an aerial map located in Appendix A. Descriptions of the individual wetlands are provided below, although these wetland determinations are assigned pending final USACE verifications.

Wetland	Latitude	Longitude	Classification	Connectivity	Wetland Area (sq feet)
PEM1	37.123234	-88.74054	PEM	Connected	16,329
PEM2	37.123283	-88.738651	PEM	Connected	8,964
PEM3	37.122399	-88.736888	PEM	Connected	36,294
PEM4	37.120611	-88.739712	PEM	Isolated	16,736

PEM1 is an emergent wetland has an area 0.37 acres and is connected directly to the eastern edge of a strip of forested area located in the northern portion of the project area. This area receives water from I6 when it overflows its banks during storm events. The area ponds water and does not drain. The dominant herbaceous stratum found within PEM1 consisted primarily of various herbaceous vegetation. The vegetation for

the data point taken within PEM1 indicated a dominant presence of hydrophytic vegetation. Additionally, various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 5/2 with redoximorphic features of 10YR 4/4 greater than 2% from 2 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM1 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics. It lies within a farmed agricultural field.

PEM2 is an emergent wetland has an area 0.21 acres and is connected directly to the northwestern edge of a forested area located in the northern portion of the project area. This area receives upland runoff from the adjacent farm field. The area ponds water and does not drain since it appears that trees and debris have been pushed into the edge of the woods and prevents the area from draining properly. The dominant herbaceous stratum found within PEM2 consisted primarily of various herbaceous vegetation. The vegetation for the data point taken within PEM1 indicated a dominant presence of hydrophytic vegetation. Additionally, various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 5/2 with redoximorphic features of 5YR 4/6 greater than 2% from 2 to 8 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM2 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics. It lies within a farmed agricultural field.

PEM3 is an emergent wetland has an area 0.83 acres and is connected directly to PFO1 wetland found in the wooded area to the west. This area receives upland runoff from the adjacent farm field as well as runoff from the roadside ditch located north and east of the area. The area ponds water and does not drain well. The dominant herbaceous stratum found within PEM2 consisted primarily of various herbaceous vegetation. The vegetation for the data point taken within PEM1 indicated a dominant presence of hydrophytic vegetation. Additionally, various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 6/1 with redoximorphic features of 5YR 4/3 greater than 2% from 3 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM3 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics.

PEM4 is an emergent wetland has an area 0.38 acres and is isolated. This area receives upland runoff from the adjacent farm field. There is a rise in topography in the field and a rise in the wooded areas that the wetland lies adjacent which creates a bowl. The wooded area is composed of rows of pecan trees that were most likely planted by the previous resident. The area ponds water and does not drain well. The dominant herbaceous stratum found within PEM4 consisted primarily of various herbaceous vegetation. The vegetation for the data point taken within PEM4 indicated a dominant presence of hydrophytic vegetation. Additionally, various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 5/2 with redoximorphic features of 5YR 4/6 greater than 2% from 2 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM4 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics.

PEM5 is an emergent wetland has an area 0.33 acres and drains into I4. This area receives upland runoff from the adjacent farm field. It appears that this area was previously clear cut and that there are deep ruts which pond water and indicate that

large equipment was used on this area at one time. The area ponds water and does not drain well. The dominant herbaceous stratum found within PEM5 consisted primarily of various herbaceous vegetation. The vegetation for the data point taken within PEM5 indicated a dominant presence of hydrophytic vegetation. Additionally, various hydrologic indicators were observed within the soils. Soils have a silty-loam texture, with a matrix of 10YR 6/1 with redoximorphic features of 5YR 5/6 greater than 2% from 2 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM5 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics.

PEM6 is an emergent wetland has an area 0.18 acres and receives water from the adjacent farm field but is considered isolated. The area ponds water and does not drain well due to farming activities and possibly from the installation of a field tile. The dominant herbaceous stratum found within PEM6 consisted primarily of various herbaceous vegetation. The vegetation for the data point taken within PEM6 indicated a dominant presence of hydrophytic vegetation. Additionally, various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 5/2 with redoximorphic features of 5YR 4/6 greater than 2% from 2 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM6 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics.

PEM7 is an emergent wetland has an area 0.11 acres and receives water from the adjacent farm field. The farmer has graded the field to drain to this area, enter the wooded area to the west, and has then dug a drainage ditch (E4) that he has routed to I4. The area ponds water and does not drain well. The dominant herbaceous stratum found within PEM7 consisted primarily of various herbaceous vegetation. The vegetation for the data point taken within PEM7 indicated a dominant presence of hydrophytic vegetation. Additionally, various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 5/2 with redoximorphic features of 5YR 4/4 greater than 2% from 2 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM7 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics.

PEM8 is an emergent wetland has an area 0.20 acres and receives water from the adjacent farm field. The farmer has graded the field to drain to this area, which then enters E5 and drains to I4. The area ponds water and does not drain well. The dominant herbaceous stratum found within PEM8 consisted primarily of various herbaceous vegetation. The vegetation for the data point taken within PEM8 indicated a dominant presence of hydrophytic vegetation. Additionally, various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 6/2 with redoximorphic features of 5YR 5/8 greater than 2% from 2 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM8 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics.

PEM9 is an emergent wetland has an area 0.05 acres and is considered isolated. This is a low depressional area adjacent to the woods that ponds water because debris has been pushed into the woods by the farmer. The area ponds water and does not drain well. The dominant herbaceous stratum found within PEM9 consisted primarily of various herbaceous vegetation. The vegetation for the data point taken within PEM9 indicated a dominant presence of hydrophytic vegetation. Additionally, various

hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 6/1 with redoximorphic features of 5YR 5/8 greater than 2% from 2 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM9 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics.

PEM10 is an emergent wetland has an area 0.28 acres and receives water from the adjacent farm field as well as overflow from I2. This is a low depressional area adjacent to the woods that ponds water and then enters the wooded area to form PFO5. The area ponds water and does not drain well. The dominant herbaceous stratum found within PEM10 consisted primarily of various herbaceous vegetation. The vegetation for the data point taken within PEM9 indicated a dominant presence of hydrophytic vegetation. Additionally, various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 6/1 with redoximorphic features of 5YR 5/8 greater than 2% from 2 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM10 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics.

PEM11 is an emergent wetland has an area 0.22 acres and receives water from the adjacent farm field as well as overflow from I3. This is a low depressional area located in the southern portion of the property that lies adjacent to Bobo Road. The area ponds water and does not drain well. The dominant herbaceous stratum found within PEM11 consisted primarily of various herbaceous vegetation. The vegetation for the data point taken within PEM11 indicated a dominant presence of hydrophytic vegetation. Additionally, various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 6/1 with redoximorphic features of 5YR 5/8 greater than 2% from 2 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils. PEM11 has a distinctive dividing line between the wetland and upland which includes changes in plant communities, soils, and hydrologic characteristics.

PFO1 is a forested wetland has an area of 2.03 acres and is connected to PEM3. Prior clearing and storm damage has resulted in the creation of a wet ponded areas within these woods. The area receives inundation from stormwater events. The dominant vegetation is primarily comprised of hickory, pin oak, jewelweed, and boneset. Various hydrologic indicators were observed within the soils. Soils have a silty-loam texture, with a matrix of 10YR 5/1 with redoximorphic features of 10YR 4/6 greater than 2% from 3 to 10 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils.

PFO2 is a forested wetland has an area of 0.40 acres and receives overflow from I6. The area receives inundation from stormwater events. The dominant vegetation is primarily comprised of hickory, pin oak, jewelweed, and small spike false nettle. Various hydrologic indicators were observed within the soils. Soils have a silty-loam texture, with a matrix of 10YR 5/1 with redoximorphic features of 10YR 4/6 greater than 2% from 3 to 6 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils.

PFO3 is a forested wetland has an area of 0.28 acres and lies in the wooded areas located north of PEM6. This is a depressional area located in the wooded area that ponds water after storm events. The dominant vegetation is primarily comprised of red maples. Various hydrologic indicators were observed within the soils. Soils have a silty-

loam texture, with a matrix of 10YR 5/2 with redoximorphic features of 10YR 4/6 greater than 2% from 3 to 10 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils.

PFO4 is a forested wetland has an area of 0.43 acres and is connected to E4. Prior clearing and storm damage has resulted in the creation of a wet ponded areas within these woods. E4 was channelized to carry the water from the site to I4. This wetland is located to the west of this conveyance and ponds water after storm events. Large tire tracks indicated that prior clearing activities probably occurred here. The dominant vegetation is primarily comprised of red maple, pin oak, and honeysuckle. Various hydrologic indicators were observed within the soils. Soils have a silty-loam texture, with a matrix of 10YR 5/2 with redoximorphic features of 10YR 4/4 greater than 2% from 3 to 10 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils.

PFO5 is a forested wetland has an area of 0.43 acres and is connected to PEM10 and E3. Prior clearing and storm damage has resulted in the creation of a wet ponded areas within these woods. Water quickly leaves the banks of E3 and ponds in these flat areas as well. The area receives inundation from stormwater events and most likely receives water from I2 overflowing as well. The dominant vegetation is primarily comprised of hickory, pin oak, red maple, and jewelweed. Various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 5/1 with redoximorphic features of 10YR 5/8 greater than 2% from 3 to 6 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils.

PFO6 is a forested wetland has an area of 1.38 acres and is connected to E3. Prior clearing and storm damage has resulted in the creation of a wet ponded areas within these woods. The area receives inundation from stormwater events when E3 overflows its banks. The dominant vegetation is primarily comprised of elm, sweet gum, pin oak, jewelweed, virginia creeper, and poison ivy. Various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 6/1 with redoximorphic features of 10YR 4/6 greater than 2% from 4 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils.

PFO7 is a forested wetland has an area of 0.31 acres and is connected to E2. This area receives stormwater runoff from I2 and from the adjacent farm field. The dominant vegetation is primarily comprised of red maple, willow, and poison ivy. Various hydrologic indicators were observed within the soils. Soils have a silty-clay texture, with a matrix of 10YR 6/1 with redoximorphic features of 10YR 4/6 greater than 2% from 0 to 12 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils.

PFO8 is a forested wetland has an area of 0.24 acres and lies adjacent to I4. This area receives stormwater runoff from the adjacent farm field. The dominant vegetation is primarily comprised of red maple, elm, and virginia creeper. Various hydrologic indicators were observed within the soils. Soils have a silty-loam texture, with a matrix of 10YR 5/2 with redoximorphic features of 10YR 4/6 greater than 2% from 0 to 10 inches. These redoximorphic concentrations within the matrix are defined indicators of hydric soils.

4.2 STREAMS

4.2.1 Intermittent Streams

There were six (6) intermittent streams located within the project boundary.

Stream	Latitude	Longitude	Habitat Score	Stream Type	Studied Length (ft)
I1	37.108159°N	88.745842°W	129.5 (avg)	Intermittent	1,666
I2	37.1115185°N	88.747592°W	79	Intermittent	1,110
I3	37.1113540°N	88.743411°W	67.5 (avg)	Intermittent	2,173
I4	37.1117237°N	88.744709°W	113 (avg)	Intermittent	3,570
I5	37.121364°N	88.745284°W	46.5 (avg)	Intermittent	1,945
I6	37.121139°N	88.743877°W	51.5 (avg)	Intermittent	1,894

Intermittent Stream 1 (I1) is located in the southern section of the study area, flowing east for 1,666 feet. It should be noted that this length only reflects what is located within the study area. This creek is not labeled on USGS topographic maps but is an unnamed tributary to Massac Creek. Due to its length, two (2) assessments were performed. The stream has an average bottom width of 12 feet and an average bankfull width of 17 feet.

The stream habitat assessment (Low Gradient) for the upstream reach (I1-US) indicates the epifaunal substrate/available cover score is in the optimal range. Streambed morphology consists of somewhat equal riffles and runs but did contain more pools; with the majority of the pools present being shallow. The stream substrate consists of silt/clay size material and cobble, but gravel made up the majority of the bottom. Some deposition of fine sediment is present, with 20-50 percent of the bottom affected. Sinuosity scored marginal which indicates that channelization may have occurred sometime in the past. During the assessment, water was utilizing up to 75 percent of the channel bottom but occurred mostly at pooled sections. The banks were moderately stable with some areas of erosion. Vegetative protection scored as sub-optimal since the majority of the assessed sections had vegetative protection. However, the riparian width scored poor to marginal since farmed fields were located just outside of the riparian zones.

The stream habitat assessment (Low Gradient) for the downstream reach (I1-DS) indicates the epifaunal substrate/available cover score is in the optimal range. Streambed morphology consists of somewhat equal riffles and runs but did contain more pools; with the majority of the pools present being shallow. The stream substrate consists of silt/clay size material and cobble, but gravel made up the majority of the bottom. Some deposition of fine sediment is present, with 20-50 percent of the bottom affected. Sinuosity scored marginal which indicates that channelization may have occurred sometime in the past. During the assessment, water was utilizing 25 - 75 percent of the channel bottom but occurred mostly at pooled sections. The banks were moderately unstable with 30-60% of the banks having areas of erosion. Vegetative protection scored as sub-optimal since the majority of the assessed sections had vegetative protection. However, the riparian width scored marginal to suboptimal since farmed fields were located further outside of the riparian zones than that which occurred upstream.

I1 has an average habitat score of 119.5, which corresponds to a stream quality rating of suboptimal. The conductivity value average was 298.5 μ S.

Intermittent Stream 2 (I2) is located in the west central section of the study area. It flows east for approximately 1,110 feet within the study boundary. The stream has an average bottom width of two (2) feet, and an average bankfull width of approximately four (4) feet.

The stream habitat assessment (Low Gradient) for the stream indicates the epifaunal substrate/available cover score is in the marginal range due to a 10-30 percent mix of stable substrate, with a less than desirable available habitat. Streambed morphology consists of mostly runs, with few riffles and pools; with the majority of the pools present being shallow. The stream substrate consists of silt/clay size material only. Heavy deposition of fine sediment is present, with more than 80 percent of the bottom affected. There is some evidence of channelization due to farming activities, and sinuosity scored marginal. During the assessment, water was utilizing 25 - 75 percent of the channel bottom. The banks were moderately stable (suboptimal score) with some areas of erosion. Vegetative protection and width of riparian zones scored marginal since farmed areas were located just outside of the stream channel in a lot of the area.

I2 has a habitat score of 79, which corresponds to a stream quality rating near the middle of the marginal category. The conductivity reading was 325 μ S.

Intermittent Stream 3 (I3), located in the east central section of the study area, and eventually empties into Massac Creek further offsite. It flows north and then east for approximately 2,173 feet until it leaves the project study area. Due to its length and change in stream type, two (2) assessments were performed. The stream has an average bottom width of approximately 3 feet, and a bankfull width average of approximately 5 feet.

The stream habitat assessment (Low Gradient) for the upstream reach (I3-US) indicates the epifaunal substrate/available cover score is in the poor range since there was a very obvious lack of habitat. Streambed morphology consists of mostly runs, with few pools; with the majority of the pools present being shallow. The stream substrate consists of silt/clay size material only. Heavy deposition of fine sediment is present, with more than 80 percent of the bottom changing frequently. There is evidence of channelization, and sinuosity scored poor. During the assessment, the only water found in the channel was in a few pooled areas. The banks were moderately unstable (marginal score) with 30-60 percent of erosional area. This is due to only having herbaceous and grass vegetation. Vegetative protection scored as marginal, and the riparian width was poor due to previous farming activities.

The stream habitat assessment (Low Gradient) for the downstream reach (I3-DS) indicates epifaunal substrate/available cover scored in the marginal range. Streambed morphology consists of mostly runs with some areas of pools. The stream substrate consists of silt/clay sized material. There was heavy deposition of fine sediment, affecting more than 80 percent of the bottom. There was evidence of some past channelization due to farmed fields to the north and south of the stream, with sinuosity scoring in the marginal range. Banks were moderately stable, with vegetative cover scoring marginal. Riparian zone width scored marginal, with the dominant riparian vegetation again consisting of all four (4) strata.

I3 has an average total habitat score of 68, which corresponds to a stream quality rating of marginal.

Intermittent Stream 4 (I4) is located along the central boundary of the study area. It flows east for approximately 3,570 feet to the property boundary and then continues off-site. The stream has a bottom width average of approximately 8 feet, and a bankfull width average of approximately 12 feet.

The stream habitat assessment (Low Gradient) for the upstream reach (I4-US) indicates the epifaunal substrate/available cover score is in the sub-optimal range since there is a stable mix of habitat. Streambed morphology consists of mostly runs, with some pools and riffles; with the majority of the pools present being shallow. The stream substrate consists of a mix of silt/clay, sand, and gravel. Moderate deposition of fine sediment is present, with 50 - 80 percent of the bottom changing frequently. There is little evidence of channelization, and sinuosity scored sub-optimal. During the assessment, water occupied greater than 50% of the channel and was flowing but also had pooled areas. The banks were moderately stable (sub-optimal score) with 5-30 percent of erosional area. The stream contained all four (4) vegetative strata. Vegetative protection scored as sub-optimal, but the riparian width was marginal due to previous farming activities.

The stream habitat assessment (Low Gradient) for the downstream reach (I4-DS) indicates epifaunal substrate/available cover scored in the optimal range. Streambed morphology consists of mixture of riffles, runs, and pools. The stream substrate consists of silt/clay sized material, sand, and gravel. There was moderate deposition of fine sediment, affecting 50-80 percent of the bottom. There was no evidence of past channelization and sinuosity scoring in the sub-optimal range. Banks were moderately stable, with vegetative cover scoring sub-optimal. Riparian zone width scored marginal due to farming activities. However, the dominant riparian vegetation again consisted of all four (4) strata.

I4 has a total habitat score of 113, which corresponds to a stream quality rating of sub-optimal. A conductivity reading average was 108 μ S.

4.2.2 Ephemeral Streams

There were a total of seven (7) ephemeral streams found within the project boundary.

Stream	Latitude	Longitude	Habitat Score	Stream Type	Studied Length (ft)
E1	37.107744°N	88.744683°W	56	Ephemeral	182
E2	37.113247°N	88.744633°W	46	Ephemeral	460
E3	37.116231°N	88.74331°W	52	Ephemeral	784
E4	37.117411°N	88.741785°W	37	Ephemeral	666
E5	37.117477°N	88.743182°W	51	Ephemeral	371
E6	37.118445°N	88.745665°W	47	Ephemeral	135
E7	37.119179°N	88.74573°W	50	Ephemeral	118

Ephemeral Streams (E1 to E7) are located throughout the project study area. Most of the streams were considered marginal streams, with the exception of E2, E4, and E6 which had poor habitat scores.

In general, the EPA stream habitat assessments for the ephemeral streams

indicated a marginal epifaunal substrate/available cover. The substrates consisted predominantly, or all, silt/clay sized material. Streambed morphology consists primarily of runs only. Typically, there was moderate to heavy deposition of new material, with 50 to 80 percent of the bottom affected. Banks were mostly moderately, many of which contained areas of erosional scarring. No conductivity readings were collected due to dry stream conditions.

4.3 OPEN WATERS

There were five (5) open waters located within the project boundary. These waters are shown in the table below.

OW	Latitude	Longitude	Studied Area (sq feet)
OW1	37.125465°N	88.746222°W	241,607
OW2	37.12476°N	88.747364°W	39,451
OW3	37.12175°N	88.741944°W	27,058
OW4	37.111445°N	88.749051°W	17,408
OW5	37.110462°N	88.747356°W	3,448

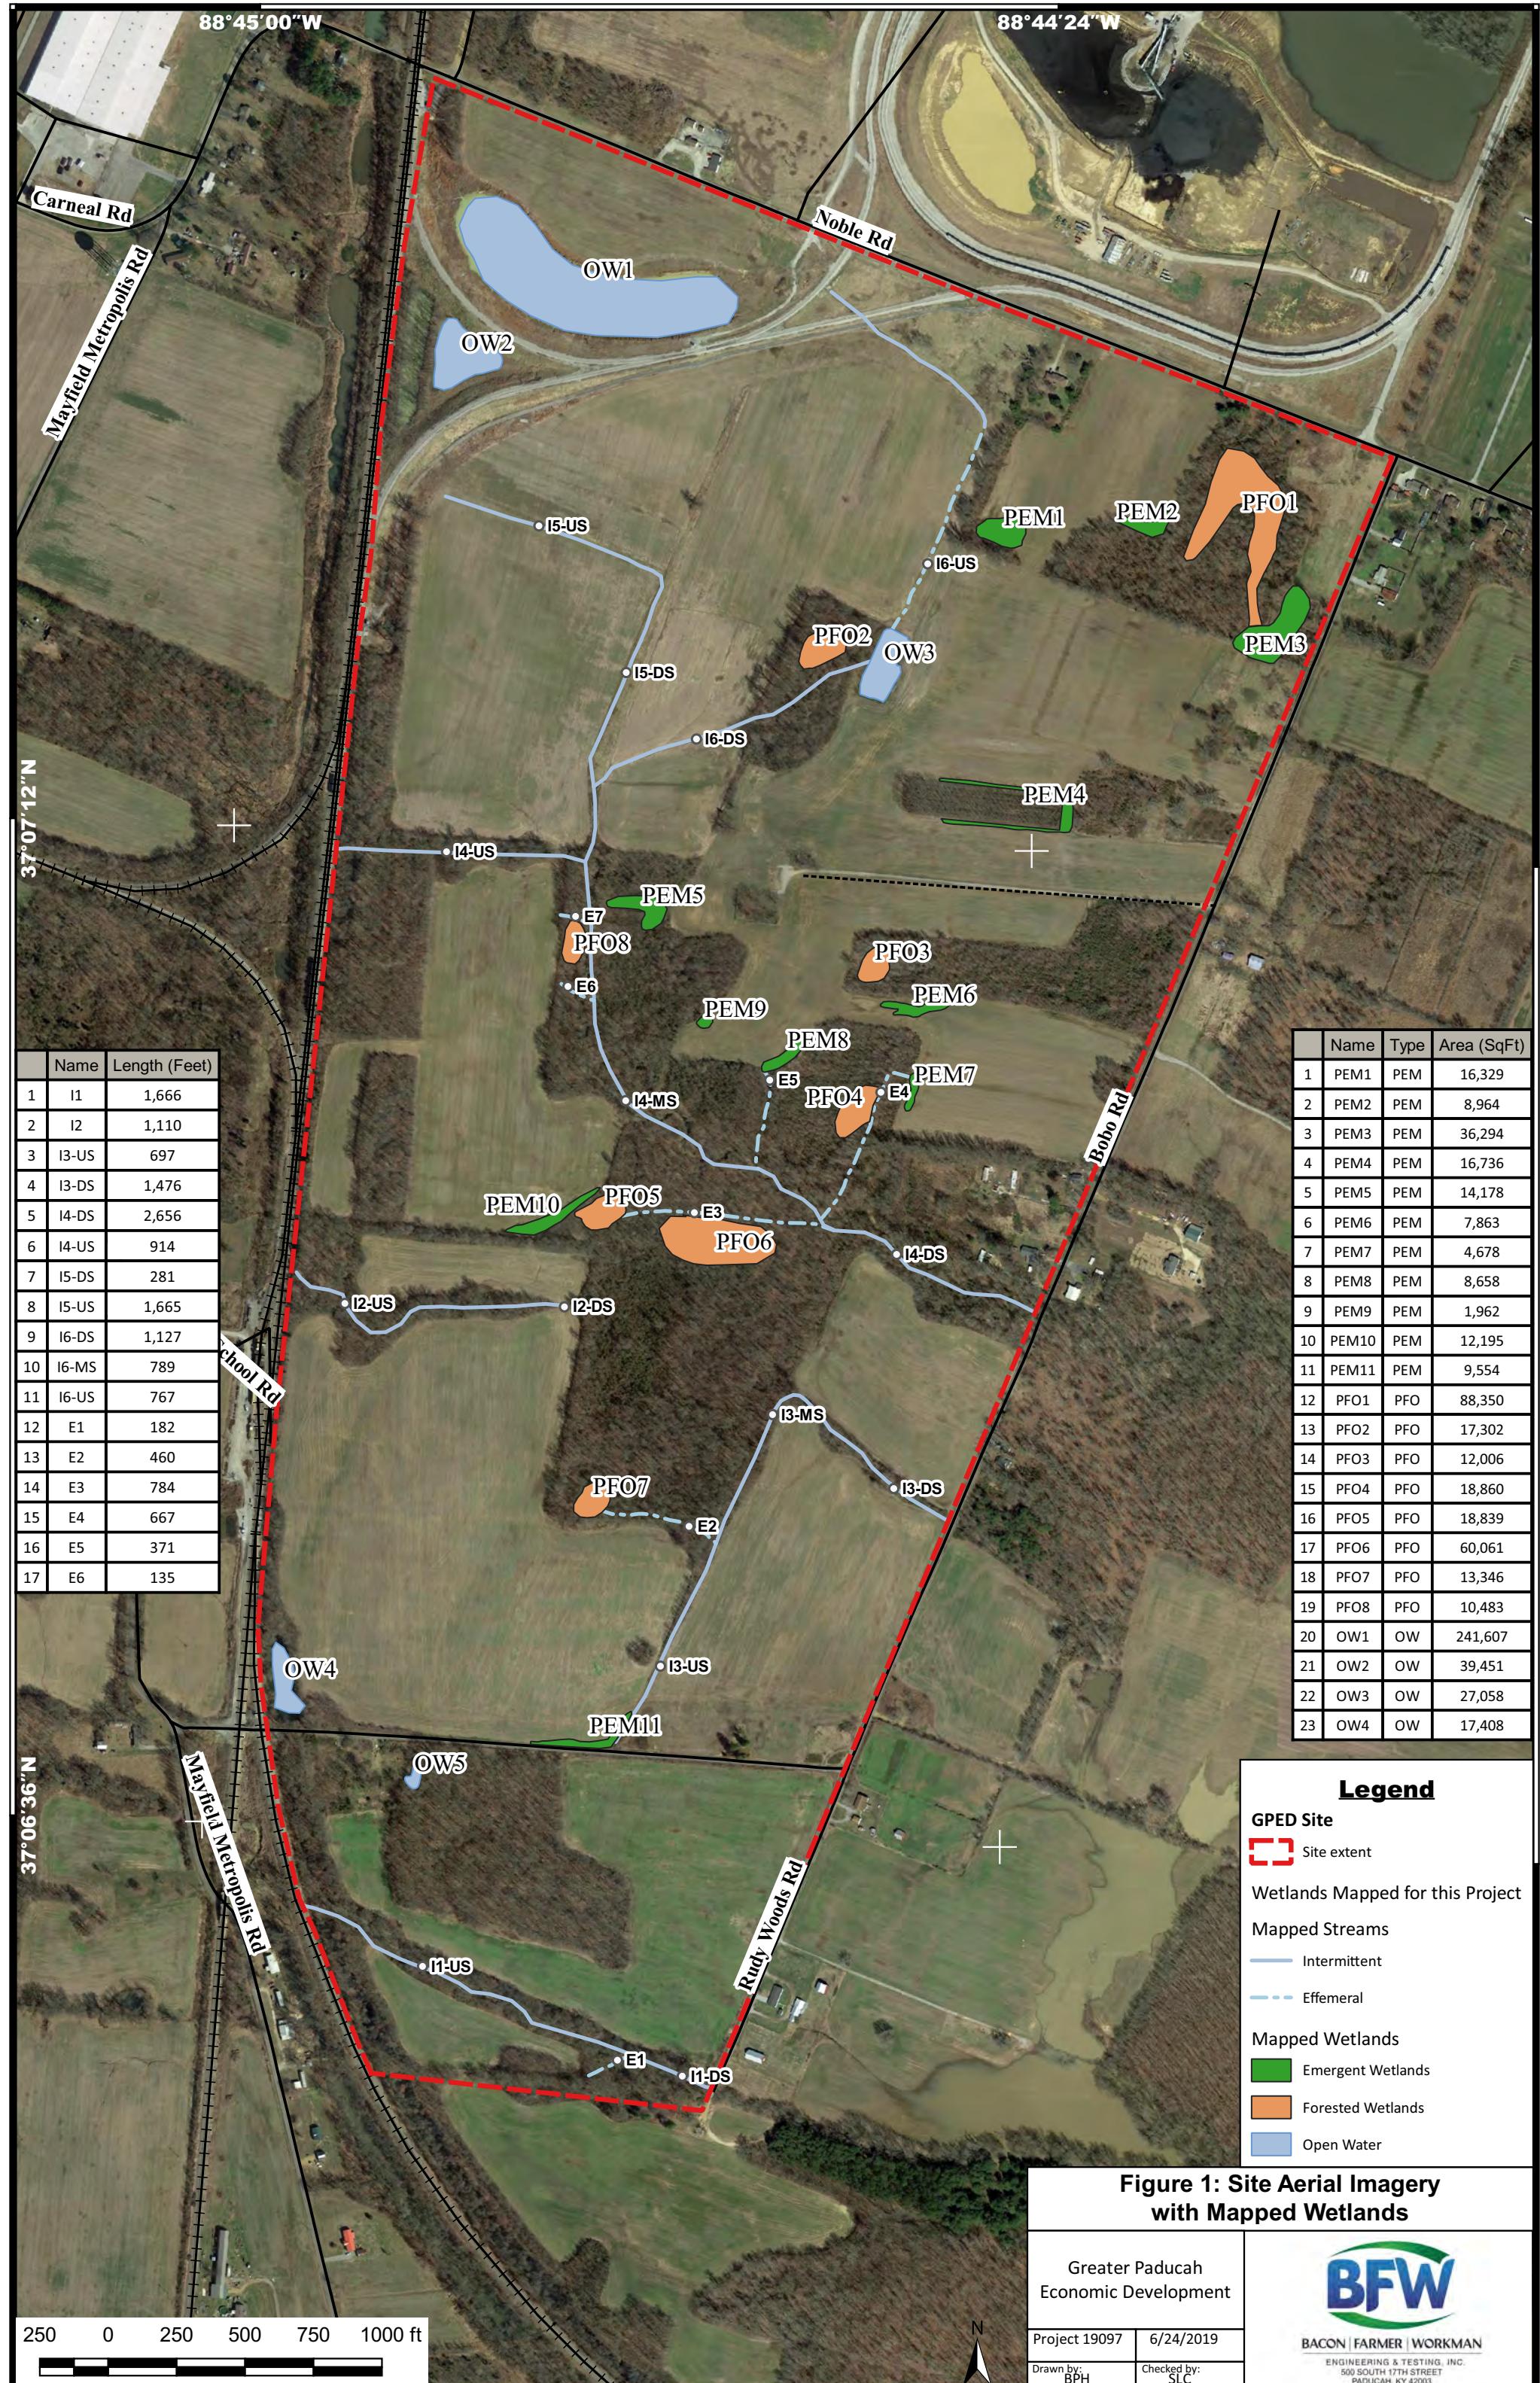

All associated data sheets for this delineation including wetland and stream assessment forms can be found in Appendix B. Photographs of the project site can be found in Appendix C.

<input checked="" type="checkbox"/> 2 - Dominance Test is >50%						
<input checked="" type="checkbox"/> 3 - Prevalence Index is $\leq 3.0^1$						
<input type="checkbox"/> Problematic Hydrophytic Vegetation ¹ (Explain)						

¹Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Four Vegetation Strata:

Tree – Woody plants, excluding vines, 3 in. (7.6 cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub – Woody plants, excluding vines, less than 3 in. DBH and greater than 3.28 ft (1 m) tall.

Herb – All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft tall.

Woody vine – All woody vines greater than 3.28 ft in height.

Hydrophytic
Vegetation
Present?

Yes No _____

Remarks: (If observed, list morphological adaptations below).

Hydrophytic Vegetation Indicators:						
<input checked="" type="checkbox"/> 1 - Rapid Test for Hydrophytic Vegetation						
<input checked="" type="checkbox"/> 2 - Dominance Test is >50%						
<input checked="" type="checkbox"/> 3 - Prevalence Index is $\leq 3.0^1$						
<input type="checkbox"/> Problematic Hydrophytic Vegetation ¹ (Explain)						

¹Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Four Vegetation Strata:

Tree – Woody plants, excluding vines, 3 in. (7.6 cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub – Woody plants, excluding vines, less than 3 in. DBH and greater than 3.28 ft (1 m) tall.

Herb – All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft tall.

Woody vine – All woody vines greater than 3.28 ft in height.

Hydrophytic Vegetation Present?

Yes No _____

Remarks: (If observed, list morphological adaptations below).

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-2	10YR5/2	100					SiCl	
2-12	10YR5/2	80	10YR4/6	20	C	M	SiCl	

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, MS=Masked Sand Grains.²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

2-12	10YR6/1	70	10YR5/8	30	C	M	SiCl	

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, MS=Masked Sand Grains.²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5)
- Organic Bodies (A6) (LRR P, T, U)
- 5 cm Mucky Mineral (A7) (LRR P, T, U)
- Muck Presence (A8) (LRR U)
- 1 cm Muck (A9) (LRR P, T)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Coast Prairie Redox (A16) (MLRA 150A)
- Sandy Mucky Mineral (S1) (LRR O, S)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Dark Surface (S7) (LRR P, S, T, U)

- Polyvalue Below Surface (S8) (LRR S, T, U)
- Thin Dark Surface (S9) (LRR S, T, U)
- Loamy Mucky Mineral (F1) (LRR O)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- Marl (F10) (LRR U)
- Depleted Ochric (F11) (MLRA 151)
- Iron-Manganese Masses (F12) (LRR O, P, T)
- Umbric Surface (F13) (LRR P, T, U)
- Delta Ochric (F17) (MLRA 151)
- Reduced Vertic (F18) (MLRA 150A, 150B)
- Piedmont Floodplain Soils (F19) (MLRA 149A)
- Anomalous Bright Loamy Soils (F20) (MLRA 149A, 153C, 153D)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR O)
- 2 cm Muck (A10) (LRR S)
- Reduced Vertic (F18) (outside MLRA 150A,B)
- Piedmont Floodplain Soils (F19) (LRR P, S, T)
- Anomalous Bright Loamy Soils (F20) (MLRA 153B)
- Red Parent Material (TF2)
- Very Shallow Dark Surface (TF12)
- Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if observed):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes No _____

Hydrophytic
Vegetation
Present?

Yes No _____

¹Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Four Vegetation Strata:

Tree – Woody plants, excluding vines, 3 in. (7.6 cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub – Woody plants, excluding vines, less than 3 in. DBH and greater than 3.28 ft (1 m) tall.

Herb – All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft tall.

Woody vine – All woody vines greater than 3.28 ft in height.

Remarks: (If observed, list morphological adaptations below).

This area has been clear cut in the past 10 years. Many smaller trees/shrubs.

SOIL

Sampling Point: PFO3

Dominance Test worksheet:
Number of Dominant Species That Are OBL, FACW, or FAC: 6 (A)

Total Number of Dominant Species Across All Strata: 6 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100% (A/B)

Prevalence Index worksheet:
Total % Cover of: _____ Multiply by: _____

OBL species 15 x 1 = 15

FACW species 15 x 2 = 30

FAC species 55 x 3 = 165

FACU species _____ x 4 = _____

UPL species _____ x 5 = _____

Column Totals: 85 (A) 210 (B)

Prevalence Index = B/A = 2.47

Hydrophytic Vegetation Indicators:

1 - Rapid Test for Hydrophytic Vegetation

2 - Dominance Test is >50%

3 - Prevalence Index is $\leq 3.0^1$

Problematic Hydrophytic Vegetation¹ (Explain)

¹Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Four Vegetation Strata:

Tree – Woody plants, excluding vines, 3 in. (7.6 cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub – Woody plants, excluding vines, less than 3 in. DBH and greater than 3.28 ft (1 m) tall.

Herb – All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft tall.

Woody vine – All woody vines greater than 3.28 ft in height.

Hydrophytic Vegetation Present? Yes _____ No _____

Remarks: (If observed, list morphological adaptations below).

This area may have been clear cut in the past 10 years. Many smaller trees/shrubs.

SOIL

Sampling Point: PFO8

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, MS=Masked Sand Grains.

²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

Vegetative Protection 9. (score each bank) Note: determine left or right side by facing downstream.		More than 90% of the streambank surfaces and immediate riparian zones covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
Score (LB)	5	Left Bank	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	10 9 8 7 6 5 4 3 2 1 0	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
Score (RB)	4	Right Bank	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	10 9 8 7 6 5 4 3 2 1 0	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
Riparian Vegetative Zone Width 10. (score each bank riparian zone) Note: determine left or right side by facing downstream.		Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
Score (LB)	4	Left Bank	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	10 9 8 7 6 5 4 3 2 1 0	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>

Vegetative Protection 9. (score each bank) Note: determine left or right side by facing downstream.		More than 90% of the streambank surfaces and immediate riparian zones covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.

2. Pool Substrate / Characterization		Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
Score	13	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
3. Pool Variability		Even mix of large shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep, very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
Score	10	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
4. Sediment Deposition		Little or no enlargement of islands or point bars and less than 20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand, or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
Score	9	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
5. Channel Flow Status		Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
Score	8	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
6. Channel Alteration		Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40-80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
Score	13	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
7. Channel Sinuosity		The bends in the stream increase the stream length 3-4 times longer than if it was in a straight line. (Note - channel braiding is considered coastal plains and other normal low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream length 2-3 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1-2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
Score	11	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
8. Bank Stability (score each bank)		Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequently along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.

2. Pool Substrate / Characterization		Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
3. Pool Variability		Even mix of large shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep, very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
4. Sediment Deposition		Little or no enlargement of islands or point bars and less than 20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand, or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
Score	3	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
5. Channel Flow Status		Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
6. Channel Alteration		Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40-80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
7. Channel Sinuosity		The bends in the stream increase the stream length 3-4 times longer than if it was in a straight line. (Note - channel braiding is considered coastal plains and other normal low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream length 2-3 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1-2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
Score	6	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
8. Bank Stability (score each bank) Note: determine left or right side by facing downstream.		Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequently along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
Score (LB)	5	Left Bank <input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	10 9 8 7 6 5 4 3 2 1 0

2. Pool Substrate / Characterization		Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
3. Pool Variability		Even mix of large shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep, very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
4. Sediment Deposition		Little or no enlargement of islands or point bars and less than 20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand, or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
5. Channel Flow Status		Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
6. Channel Alteration		Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40-80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
7. Channel Sinuosity		The bends in the stream increase the stream length 3-4 times longer than if it was in a straight line. (Note - channel braiding is considered coastal plains and other normal low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream length 2-3 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1-2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
8. Bank Stability (score each bank)		Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequently along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.

7. Channel Sinuosity		The bends in the stream increase the stream length 3-4 times longer than if it was in a straight line. (Note - channel braiding is considered coastal plains and other normal low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream length 2-3 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1-2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
Score	2	<input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
8. Bank Stability (score each bank) Note: determine left or right side by facing downstream.		Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequently along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
Score (LB)	6	Left Bank <input type="checkbox"/>	10 9 8 7 6 5 4 3 2 1 0		
Score (RB)	6	Right Bank <input type="checkbox"/>	10 9 8 7 6 5 4 3 2 1 0		

Vegetative Protection 9. (score each bank) Note: determine left or right side by facing downstream.		More than 90% of the streambank surfaces and immediate riparian zones covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
Score (LB)	4	Left Bank	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	10 9 8 7 6 5 4 3 2 1 0	
Score (RB)	4	Right Bank	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	10 9 8 7 6 5 4 3 2 1 0	
Riparian Vegetative Zone Width 10. (score each bank riparian zone) Note: determine left or right side by facing downstream.		Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.

2. Pool Substrate / Characterization		Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
3. Pool Variability		Even mix of large shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep, very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
4. Sediment Deposition		Little or no enlargement of islands or point bars and less than 20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand, or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
Score	2	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
5. Channel Flow Status		Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
6. Channel Alteration		Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40-80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
Score	1	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
7. Channel Sinuosity		The bends in the stream increase the stream length 3-4 times longer than if it was in a straight line. (Note - channel braiding is considered coastal plains and other normal low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream length 2-3 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1-2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
Score	6	<input type="checkbox"/> <input checked="" type="checkbox"/> <input type="checkbox"/>	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0		
8. Bank Stability (score each bank) Note: determine left or right side by facing downstream.		Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequently along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
